

Topics of Discussion
Long-Range Planning Committee Meeting
New York - Spring 1986

Programming discussions were centered around the many facets of the following topics:

- Atmospheric chemistry
- Photochemical oxidants
- Indoor air quality
- Bioactivity of atmospheric pollutants
- Volcanic emissions
- Risk assessment
- Toxicology
- Heterogeneous environmental chemistry
- Lake and stream studies
- Water as a source of indoor contaminants
- Chemometrics
- Environmental biochemistry
- Sediment chemistry
- Public health chemistry
- Sanitary chemistry/engineering
- Environmental modeling
- Hazardous wastes
- Generation of physical-chemical rate constants
- Ecology
- Marine chemistry

It was pointed out that at the Anaheim meetings the atmospheric programming had been expanded. An effort should be made to encourage more participation by the atmospheric chemist types in the Division.

There was considerable discussion regarding better communications and the need to pursue possible co-sponsored programs with SETAC, AEEP, NALMS, AICHE, etc.

Is there a need to develop/sponsor workshops by the Division? It was suggested that a workshop be sponsored by the Division at the 1987 Jekyll Island Conference.

Should the Division sponsor "traveling road shows" in conjunction with local sections?

Will sponsoring workshops, etc., outside the national ACS meeting enhance the Division?

Individuals should be sought out who are willing to assist Bob Jolley in organizing symposia for future meetings.
